On this page, the chemical names for different reactions are given, write down their formulas in a skeleton equation (using the ionic charges of various elements sheet), and then balance the equation you wrote.

Hint: In the examples below the gases made from only one element are actually made of molecules containing 2 atoms of that element, whereas the solids made from only one element are made from just 1 atom of that element.

1. Copper(III) oxide combines with hydrogen gas to produce solid copper and water.

$$
\mathrm{Cu}_{2} \mathrm{O}_{3}+3 \mathrm{H}_{2} \quad=>2 \mathrm{Cu}+3 \mathrm{H}_{2} \mathrm{O}
$$

2. Lead (II) nitrate combines with potassium iodide to create lead (II) iodide and potassium nitrate.
$\mathrm{Pb}\left(\mathrm{NO}_{3}\right)_{2}+2 \mathrm{KI} \quad==>\quad \mathrm{PbI}_{2}+2 \mathrm{~K}\left(\mathrm{NO}_{3}\right)$
3. Calcium metal and water combine to produce calcium hydroxide and hydrogen gas.
$\mathrm{Ca}+2 \mathrm{H}_{2} \mathrm{O} \quad==>\quad \mathrm{Ca}(\mathrm{OH})_{2}+\mathrm{H}_{2}$
4. Lead(II) sulphide and oxygen gas combine to form lead and sulphur dioxide.
$\mathrm{PbS}+\mathrm{O}_{2}==>\quad \mathrm{Pb} \quad+\quad \mathrm{SO}_{2}$
5. Hydrogen sulphide can be broken into hydrogen gas and solid sulphur.
$\begin{array}{llll}\mathrm{H}_{2} \mathrm{~S} & ==> & \mathrm{H}_{2} \quad+\quad \mathrm{S}\end{array}$
