

Bends towards the normal because it slows down	Calcium carbonate	Liver, pancreas, gallbladder	violet
Atoms are neutral (equal protons & electrons) Ions are charged and have a full valence shell	+ hi = upright image - hi = inverted/upside down image	Between F & mirror	Alveoli – gas exchange via diffusion between respiratory and capillaries of circulatory Villi – increase surface areas to speed up diffusion of molecules from intestines (digestive) to capillaries of circulatory system
Double displacement	Branched = many connections Long = can carry messages long distances	Look at its group # Group 6 all have 6 valence electrons, need 2 more to have a full valence shell, charge is 2-	Heat produce, light produce, new solid, new colour, bubbles produced...
